Preface

This annual supplement to *Producer Prices and Price Indexes* presents monthly indexes and annual averages for 1981. In most cases, data are the same as revised data published in successive monthly issues of this periodical. The supplement also provides information on the relative importance of index components at the end of the year. In addition, historical annual indexes for selected stage-of-processing groupings, rebased historical indexes for bituminous coal by region, and 1981 indexes for the newly introduced postal services series are included.

Information on changes in the sample for Producer Price Indexes is no longer being published in the annual supplement. Such information can be found in the July 1981, January 1982, and February 1982 issues.

Monthly Indexes and Annual Averages for Producer Price Indexes, 1981

Tables 1 through 11 present 1981 monthly indexes and annual averages for all categories covered under the Producer Price Index program. Data shown are the revised data published in successive monthly issues of *Producer Prices and Price Indexes.* (All monthly data are subject to revision 4 months after original publication.)

Table 12 presents, for the first time, historical annual averages for ten major stage-of-processing indexes. Data for 1976 through 1979 may differ from those previously published because SOP indexes from 1976 through 1980 were revised at the beginning of 1981 to reflect updated input-output relationships. (See the January 1981 issue for further details.)

1981 indexes calculated under the survey for the Producer Price Index Revision program are not presented in this supplement; these data can be found in the monthly issues of this periodical.

[1] Since February 1973, all prices have been lagged one month. Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

[1] These indexes are calculated by combining indexes listed below by commodity code after each special commodity grouping (titles in table 3). Weights are those used for the comprehensive All Commodities index.

[2] Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

All commodities except farm products; 02 through 15

All foods: 01-1, 01-7, and 02 less 02-61, 02-62, and 02-9

Processed foods: 02 less 02-61, 02-62 and 02-9

Industrial commodities less fuels and related products and power: 03, 04, and 06 through 15

Selected textile mill products: 03-27, 03-37-01-05, 03-37-01-07, 03-37-01-09, 03-37-01-11, 03-4, 03-81-01-55, 03-81-01-72, 03-81-01-73, 03-81-02-39, 03-81-02-72, 03-81-02-74, 03-81-03-62, 03-81-03-64, 03-82-01, 03-82-02, 03-83-03-22, 03-83-03-42, and 12-31

Hosiery: 03-81-01-72, 03-81-01-73, 03-81-02-72 and 03-81-03-64

Underwear and nightwear: 03-81-01-74, 03-81-01-75, 03-81-01-76, 03-81-01-77, 03-81-01-78, 03-81-02-74, 03-81-02-75, 03-81-02-78, and 03-81-03-62

Chemicals and allied products, including synthetic rubber and synthetic fibers: 03-1, 06 less 06-4, and 07-11-02

Pharmaceutical preparations: 06-34, 06-35, and 06-38

Lumber and plywood[3]: 08-1 and 08-3

Special metals and metal products: 10, 11-1, and 14-1

Fabricated metal products: 10-3, 10-4, 10-5, 10-6, 10-7, and 10-8

Copper and copper products: 10-22-01-23, 10-22-01-24, 10-22-01-25, 10-23-01, 10-24-03-01, 10-24-03-02, 10-24-03-04, 10-24-03-05, 10-25-02 and 10-26-01

Machinery and motive products: 11 and 14

Machinery and equipment, except electrical: 11-1, 11-2, 11-3, 11-4, 11-6, 11-8, and 11-9

Agricultural machinery including tractors:
11-11 and 11-12 less 11-11-51 and 11-12-51

Metalworking machinery: 11-32, 11-33-04, 11-37, and 11-38

Numerically controlled machine tools:
11-37-11-11, 11-37-11-12, 11-37-14-11, and 11-37-16

Total tractors: 11-11 and 11-28 less 11-11-51, 11-28-02, and 11-28-03

Industrial valves: 11-49-01-01 through 11-49-01-06, 11-49-01-16 through 11-49-01-19, and 11-49-01-21 through 11-49-01-27

Industrial fittings:
11-49-01-11 through 11-49-01-15

Agricultural machinery and equipment, less parts (old commodity code 11-1): 11-1 less 11-11-51 and 11-12-51

Farm and garden tractors, less parts (old commodity code 11-11): 11-11 less 11-11-51

Agricultural machinery excluding tractors, less parts (old commodity code 11-12): 11-12 less 11-12-51

Construction materials:

[1] Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Revised indexes may not agree with previously published revised data because of a comprehensive historical revision which became effective with the April 1982 issue of this publication.

[2] Telephone services contained in the Consumer Price Index cover not only local residential service, but also parts of toll service, equipment leasing (such as extension phones), and non-recurring charges (such as installation).

Relative Importance

Tables 13, 14, and 15 contain relative importance data as of December 1981 by stage of processing; by commodity groups, subgroups, product classes, and individual items; and for the output of selected Standard Industrial Classification industries and census product classes.

The relative importance of a category on a specific date represents the value of shipments for that category plus the value of unpriced commodities assumed to have price movements similar to those of the priced items. Relative importance data are generally expressed as a percentage of the total weight of some composite grouping, such as the All Commodities Index, the Finished Goods Index, etc.

Guidelines for combining components to construct special indexes are presented on the following page of this publication. For a description of the procedures for calculating relative importance data, see *Producer Prices and Price Indexes, Supplement 1979, Data for 1978.*

Calculation of Special Producer Price Indexes

To satisfy specific needs, data users sometimes want aggregate indexes other than those routinely calculated in the Producer Price Index. To meet some of these requirements, special-purpose indexes may be constructed from published Producer Price Indexes and relative importance data. A special index calculation may combine two or more PPI'S into a new composite index representing the aggregated set or delete one or more components from an available published higher level Producer Price Index grouping. As long as all indexes are expressed on a common base period, the value of a particular index grouping equals the weighted average of the index values of its component categories.

Relative importance data are appropriate weights for combining these indexes. However, special problems may arise when the interval between the index base and the calculation period includes a sample change or a shift in weighting structure, which occurs when the PPI incorporates updated value-of-shipments data. As product coverage in the PPI revision program has expanded, such changes have become more frequent. In such cases, the computation procedure becomes more complex and the research more laborious, as it is necessary to identify each shift in the sample or weighting structure so as to make the appropriate adjustments to ensure a continuous series of comparable data. (*Producer Prices and Price Indexes, Supplement 1979, Data for 1978*, p. 10.) In addition, when indexes are on different base periods, all indexes must be rebased to a common base period.

Problems mentioned earlier do not affect the following examples, which are relatively simple and cover a limited time period. Data users should be cautious about complicated situations, particularly with specially constructed indexes comparing price levels across a span of several years. Any procedural questions may be addressed to: Analysis Team, Division of Industrial Prices and Price Indexes, Bureau of Labor Statistics, Room 5210, 600 E St., N.W., Washington, D.C. 20212.

Separate series combined into a single price index

A special index for lumber and plywood may be constructed by aggregating the price movements and relative importance data of both categories. Results will be checked against the special grouping index "Lumber and plywood" in table 6 of this supplement. The computation procedure for any given month may be expressed algebraically as follows:

$$I_{lp} = (I_l)(RI_l) + (I_p)(RI_p)$$

Where I_{lp} = index for lumber and plywood
I_l = index for lumber
RI_l = relative importance of lumber
I_p = index for plywood
RI_p = relative importance of plywood

First, collect the data for the months in question, and select an index base date to serve as the initial reference point. The base date must be December because relative importance figures are only calculated in December; furthermore, the base date must be after the most recent major weight revision took effect (currently December 1975). All indexes for the base period are set equal to 100, by definition. For these examples, December 1980 is the selected base period.

Second, convert indexes for later time periods to the selected base of December 1980 = 100 by dividing the index values for the later periods by the index value for December 1980 for each respective series, and multiplying the result by 100 (table A).

Third, normalize the relative importance data so the fractions sum to 1; this is accomplished by dividing the value for each component into the value for the combined group.

Fourth, substitute the values computed in steps two and three into the above equation to derive the values of the special index. Each rebased value is multiplied by the corresponding normalized relative importance, and the results are summed to yield the value of the combined special index. In the March 1982 calculations, for example, substitute the following values into the equation:

$$I_{lp} = (92.5)(.722) + (90.0)(.278)$$
$$I_{lp} = (66.79) + (25.02)$$
$$I_{lp} = 91.81$$

A comparison of the calculated special index with the index from table 6 indicates that all values are within one-tenth of a point of each other (discrepancies are assumed to be due to rounding), which validates the procedure. Although this example combines only two indexes, the same procedures may be used to combine several separate categories into a single price index.

Exclusion of a component category from a grouping index

For a special index which excludes one or more components from a published grouping, the concepts remain the same, but procedures are slightly modified. To calculate an index for drugs and pharmaceutical preparations excluding materials, the algebraic formulation of the overall category for any given month is as follows:

$$I_a = (I_b)(RI_b) + (I_c)(RI_c)$$

Where I_a = index for drugs and pharmaceutical preparations

I_b = index for drugs and pharmaceutical preparations except materials

RI_b = relative importance of drugs and pharmaceutical preparations except materials

I_c = index for drugs and pharmaceutical materials

RI_c = relative importance of drugs and pharmaceutical materials

Unlike the previous example where the unknown quantity was on the left hand side and all right hand side quantities were known, in this case the unknown quantity is the special index I_b. Its relative importance (RI_b) equals $(1 - RI_c)$, so we may rearrange the equation to solve for the unknown:

$$I_b = \frac{(I_a)-(I_c)(RI_c)}{RI_b}$$

As shown in table B, steps one and two are identical to those in the earlier example. In step three, the relative importance data are normalized so that the combined index equals 1 and the relative importance of the special index equals 1 minus the relative importance of the excluded categories.

Finally, substitute proper values into the above equation to determine the special index. The March 1982 calculation would be:

$$I_b = \frac{(112.2)-(102.2)(.153)}{.847}$$

$$I_b = \frac{(112.2)-(15.6)}{.847}$$

$$I_b = \frac{96.6}{.847}$$

$$I_b = 114.0$$

These same procedures may be used to construct a special index which excludes more than one component category. In addition, special indexes in the stage-of-processing framework may be constructed in the same way, except that the relative importance data by stage of processing must be used (as shown for December 1981 in table 11 of this supplement) instead of traditional commodity grouping relative importance data (as shown in table 12). (See *Producer Prices and Price Indexes, Supplement 1979, Data for 1978*, p. 11.)

[1] The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials— expressed as a percentage of the total weight of the SOP category. See note on relative importance on p. 92.

NOTE: Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005. A dash in the "Former" column indicates a new SOP allocation effective January 1982; a dash in the "Revised" column indicates that the series is no longer included in the indicated SOP category.

[1] Comprehensive relative importance figures are computed once each year in December. See note on p. 92. The "Revised" column shows relative importance figures for December 1981 based on 1972 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1982; the "Former" relative importance figures are for the same month before the revision of the index sample. Except for recodes, a dash in the "Former" column indicates the series was introduced in January 1982, and a dash in the "Revised" column indicates that the series was discontinued as of January 1982.

[2] The relative importance data for the three major SOP groupings—Finished Goods, Intermediate Materials, and Crude Materials—do not add up to 100.000 because they exclude the portion of goods which are allocated to government purchases and exports.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values of all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change

Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0

Index Percent Change

Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Data from the 1981 Producer Price Index (PPI) revision are not included in this supplement because of limited resources. They will be found in the monthly issues of this report in table 4, "Producer price indexes for the net output of selected industries and their products." Table 4 of the monthly issues of this report includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7 digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed monthly in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published monthly in table 4 correspond to 8-digit commodities published monthly in table 6 (table 3 of this supplement). Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI'S in tables 11, 12, and 13 (tables 7 and 8 of this supplement). In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI'S do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
